

# Denmark

## Facts

Population of 5,86 Mio.

EU-membership since 1973

Coalition Government composed of Social-Democrats, Liberal-conservatives and Liberal-centralists

## Denmark's strategy regarding AI regulation

- create a coherent and borderless single market for AI in the EU
- develop language solutions: which languages are recognizable by AI? should small languages such as Danish be included?
- demands more open public-sector data for AI
- stresses the importance of leading research on AI in order to understand it before using it
- make use of AI for economic growth and innovation, led by small and medium enterprises

## Goal regarding the AI Act

- Focus on the possibilities AI creates regarding innovation.
- Avoiding innovation-inhibiting regulation, support small and medium enterprises.
- Limit the scope of application; less regulation to enable more innovation.
- Forbid the use of social scoring by governments, not necessarily by private companies.
- Accelerate the progress, no lagging behind in the area of AI, compared to China and the USA.

## Denmark's stance to the European AI Act

### Article 3 - Definitions

*"Precise, but not noxious."*

- Denmark advocates that the European Union must avoid regulations with an innovation-inhibiting effect. Thus, it is important to limit the scope of application to the forms of AI that necessarily require regulation; the current definition would restrict even simple statistical systems.
- The definition of AI should be more precise to allow users to understand in which cases they need to adhere to the standards set in the AI Act.

### Article 5 - Prohibited artificial intelligences practices

*"When AI is being used, we must reconcile basic rights with the public benefit."*

- The practice of social scoring should be prohibited.
- To allow innovation, only a few practices should be prohibited; only if the AI in general cannot be applied according to EU values, it should be prohibited entirely, otherwise it is possible to restrain its use via requirements.

### Article 6 - Classification rules for high-risk AI-systems

*"We must create a multi-level risk-based approach on AI."*

- Already existing sector-specific regulatory regimes should be reviewed and expanded. In this way, we recognize AI-specific requirements where the use of AI in the specific use case gives rise to additional risks. This approach allows an appropriate regulation.
